

GiffMeMoney · plain-language guide

How a **\$20** investment actually grows — and how this app does it.

No finance degree needed. This guide explains, in everyday words and simple flowcharts, how investing turns money into more money, why we use the maths we use, and exactly what your app does at every step — so you understand it and can explain it to anyone.

Real growth, explained simply

Why these algorithms

Honest about risk

How your \$20 turns into profit

When you invest, your money doesn't sit still — it buys a small piece of something real that can grow or pay you. Follow the arrows: this is the whole idea on one page.

① You put in \$20

Your money goes into a wallet, ready to be put to work.

▼ BUYS A SLICE

② It buys a tiny piece of a real asset

A share of a company, a bit of crypto, or a basket (ETF). You now own something — like owning one goat in a herd, or one brick of a shop.

▼ THREE WAYS IT EARNS

Price rises

Buy the goat for \$20, it grows, market price rises, sell for \$24. The \$4 is profit. ("Capital gain.")

It pays you

Like a mango tree giving fruit every season — some companies pay owners a small cash share. ("Dividend.")

Compounding

Reinvest the profit and next time you earn on a bigger amount. The goat has a kid; now two goats. Money making money.

③ Over time, your slice is worth more — and you can withdraw anytime

Sell when you like and take your money out. Profit is what you get back minus the \$20 you put in.

What \$20 realistically becomes (≈10%/year, a healthy market average)

TIME INVESTED	YOUR \$20 GROWS TO ≈	PROFIT	WHAT IT MEANS
1 year	\$22	\$2	Great percentage, small in dollars — that's just starting tiny.
5 years	\$32	\$12	Compounding starts to show.
10 years	\$52	\$32	Your money more than doubled — without you doing anything.
30 years	\$350	\$330	The "slow magic" — patience is the real superpower.

The honest reality (and your app agrees)

Turning **\$20 into \$2,000 in two months** means earning about **+11% every single day**. No real investment does that — that's a lottery ticket, and lottery tickets usually lose. Your app actually **flags this as impossible** on purpose. Real wealth is **small + regular + patient**: invest a little, often, for years.

✓ And the other side of the coin

Prices can fall too — your \$20 could dip to \$16. That's why the app keeps a **cash cushion** and can **auto-sell if a holding drops too far**, so one bad day can't wipe you out.

The “algorithms,” in plain words — and why these

An investing algorithm is just a **written rule** for what to buy, how much, and when to sell — so a computer follows it calmly, the same way every time, with no fear and no greed. The app has ~73 rules, but they’re really **five families**, each answering one human question.

① VALUE — THE CAREFUL BUYER

“Is this a good business at a fair price?”

Like reading a shop’s account book before buying it: Is it actually profitable? Buried in debt? Cheap for what it earns? **This is how Warren Buffett got rich.**

DCF · Graham · Piotroski · Magic Formula · Altman-Z

② MOMENTUM — THE TREND RIDER

“Which way is the crowd moving?”

A crowd running one way usually keeps going a while. Ride the trend; step aside when it turns. **One of the most proven patterns in 200 years of markets.**

Moving averages · MACD · Dual Momentum · Trend-following

③ MEAN REVERSION — THE RUBBER BAND

“Has it stretched too far and will snap back?”

A rubber band pulled too far snaps back. A price that spikes unusually high or low often returns toward normal. Good for shorter swings.

RSI · Bollinger Bands · Z-score reversion

④ RISK — THE BODYGUARD

“How do I not lose my shirt?”

Don’t put all eggs in one basket; spread across things that don’t all fall together; size each bet so one loss can’t ruin you. **Markowitz won a Nobel Prize proving this.**

Markowitz · Sharpe/Sortino · VaR/CVaR · Kelly

⑤ PRICING — THE FORTUNE-TELLER (HONEST ONE)

“What’s a fair price, and what could happen?”

Instead of faking one certain future, it **rolls the dice thousands of times** to show a range: best case, normal, worst case.

CAPM · Black-Scholes · Monte Carlo · GARCH

WHY NOT THE OTHERS?

We deliberately threw out **hot-tip picking, chart “magic” with no evidence, and anything promising guaranteed or huge returns** — that promise is the #1 sign of a scam. We kept only methods that are **published, peer-reviewed, and decades-tested.**

The vote

Why blend 73 instead of trusting one? No single rule is right all the time — each family shines in different “weather” (calm, boom, crash). The app asks them all and goes with the **weighted consensus**, like a council of experienced elders voting — steadier than betting everything on one loud opinion. Then it shows the **range of outcomes**, not a fake single number.

Your app, end to end — what actually happens

Here's the whole machine in one read. Each box is a real part of what you built; the arrows are the journey a user takes from signing in to taking money out.

How to explain it — and convince others (honestly)

The strongest pitch isn't "get rich quick." It's "grow your money the disciplined, proven, risk-managed way — and understand exactly what's happening." Honesty is what earns trust.

Why this beats guessing on your own

- **No emotions.** It follows rules, so it doesn't panic-sell or chase hype like people do.
- **Spreads risk for you.** Nobel-prize maths splits money so one bad pick can't sink you.
- **Many experts, not one.** 73 proven methods vote, instead of one risky hunch.
- **Shows the downside.** You see the worst case before you commit, not after.
- **Teaches you.** Every recommendation comes with a plain "why."

What to be honest about

- **Returns are modest.** Good investing is ~8–10%/year on average, not 100×.
- **You can lose money.** It manages risk; it can't remove it.
- **It needs time.** The magic is compounding over years.
- **It's practice data today.** A learning tool first; going live is a deliberate, separate, gated step.

💡 Say it like this to a friend with no finance background:

"It's not a magic money machine — anyone who promises that is lying. It's a calm, disciplined helper. You put in a little, it spreads it across solid choices using maths that won a Nobel Prize, it protects you if things drop, and it shows you the honest range of what could happen. Start small, add a bit each month, and let time do the heavy lifting."

How to actually start — the only three rules that matter

1

Start small

Only money you won't need soon. \$20 is a fine place to learn.

2

Add regularly

A little every month beats one lucky bet. This is the real secret.

3

Be patient

Let compounding work for years. Don't panic when it dips.

The one-line bottom line

The maths doesn't create a secret fortune — it **removes panic, spreads risk, and tells the truth**. Do the boring superpower (small, regular, patient) and your money grows the way real wealth is actually built.
